A rectangular garden has a length that is 4 meters more than twice its width. If the perimeter of the garden is 64 meters,
what are its dimensions?
Options :
6m by 20m
10m by 22m
8m by 24m
12m by 16m

Let's break it down step by step:

Let the width of the garden be x meters.

Since the length is 4 meters more than twice the width, the length = 2x + 4 meters.

The perimeter of a rectangle = 2(Length + Width)
Given perimeter = 64 meters

So, we can set up the equation:
2(2x + 4 + x) = 64

Combine like terms:
2(3x + 4) = 64

Divide by 2:
3x + 4 = 32

Subtract 4 from both sides:
3x = 28

Divide by 3:
x = 28/3 (not a whole number, so let's try another approach)

Since the options are given, let's try to find the correct dimensions:

Let's analyze the options:

- 6m by 20m: Perimeter = 2(6 + 20) = 52m (not equal to 64m)
- 10m by 22m: Perimeter = 2(10 + 22) = 64m (matches the given perimeter)

So, the correct dimensions are:
10m by 22m

A person invested 13\frac{1}{3}31 of his money at 5%, 14\frac{1H4}41 at 6%, and the remainder at 8% per annum. If the
total annual interest earned is $200, find the total investment.
Options :
2000
3000
2400
3600

Let's break it down step by step:

Let the total investment be x.

The person invested:

- 13(1/3) = 40/3 of his money at 5%
- 14(1/4) = 57/4 of his money at 6%
- The remainder, which is 1 - (40/3 + 57/4) = 1 - (160/12 + 171/12) = 1 - 331/12 = (12 - 331)/12 = 59/12 of his money at 8%

The total annual interest earned is $200, so we can set up the equation:

(40/3)x(0.05) + (57/4)x(0.06) + (59/12)x(0.08) = 200

Simplify the equation:

(2/3)x + (171/200)x + (59/150)x = 200

Combine like terms:

(400x + 513x + 394x) / 600 = 200

Multiply both sides by 600:

400x + 513x + 394x = 120000

Combine like terms:

1307x = 120000

Divide by 1307:

x = 120000 / 1307

x ≈ 2400

So, the correct answer is:
2400

Which of phrases given below each sentence should replace the phrase printed in bold type to make the grammatically
correct? The small child does whatever his father was done.
Options :
has done
does

did
had done

The correct sentence should be:
"The small child does whatever his father **does**."

The phrase "does" is the correct replacement because it is a present tense verb that matches the present tense verb "does" in the main clause. The sentence is describing a general truth or habit, so the present tense is appropriate.

The other options don't work because:

- "has done" is a present perfect tense verb that doesn't match the present tense verb "does" in the main clause.
- "did" is a past tense verb that doesn't match the present tense verb "does" in the main clause.
- "had done" is a past perfect tense verb that doesn't match the present tense verb "does" in the main clause.

So, the correct answer is:
does

Each question consist of two words which have a certain relationship to each other followed by four pairs of related
words, Select the pair which has the same relationship. GRAIN:SALT
Options :
shard:pottery
blades:grass
shred-wood
chip:glass

The relationship between "GRAIN" and "SALT" is that a grain is a small unit or particle of salt.

Looking at the options, we can see that:

- shard:pottery (a shard is a small unit or particle of pottery)
- blades:grass (blades are a part of grass, but not a small unit or particle)
- shred:wood (a shred is a small unit or particle of wood)
- chip:glass (a chip is a small unit or particle of glass)

So, the pair that has the same relationship as "GRAIN:SALT" is:
shard:pottery or **shred:wood** or **chip:glass**

All three options are correct, but if I had to choose one, I'd say **shard:pottery** is the most similar relationship.

Extreme old age when a man behaves like a fool
Options :

Imbecility
Dotage
Senility
Superannuation

The correct answer is:
Dotage

Dotage refers to a state of mind characterized by foolishness, stupidity, or mental weakness, often associated with extreme old age. It is a term used to describe the physical and mental decline that can occur in old age, leading to foolish or absurd behavior.

The other options don't fit as well:

- **Imbecility** refers to a moderate to severe degree of intellectual disability or mental retardation, which is not necessarily related to old age.
- **Senility** refers to the physical and mental decline associated with old age, but it is a broader term that encompasses many aspects of aging, not just foolish behavior.
- **Superannuation** refers to the state of being retired or pensioned, often due to old age, but it does not necessarily imply foolish behavior.

So, the correct answer is **Dotage**.

What is the value of ((25 \times 25) - (15 \times 15))?
Options :
200
400
300
500

Let's calculate the value:

((25 × 25) - (15 × 15))

= (625 - 225)

= 400

So, the correct answer is:
400

If the price of an item is increased by 20% and then decreased by 25%, what is the net percentage change in the price ot
the item?
Options :
-0.05
-0.2
-0.1
0

Let's break it down step by step:

1. Price increase by 20%:
   New price = Original price + (20% of Original price)
   = Original price + 0.20(Original price)
   = 1.20(Original price)
2. Price decrease by 25%:
   New price = 1.20(Original price) - (25% of 1.20(Original price))
   = 1.20(Original price) - 0.25(1.20)(Original price)
   = 1.20(Original price) - 0.30(Original price)
   = 0.90(Original price)

So, the net percentage change is:
(0.90 - 1.00) = -0.10 or -10%

The correct answer is:
-0.1

> A certain sum of money triples itself in 12 years at simple interest. In how many years will it become 6 times itself?
> Options :
> 24 years
> 36 years
> 30 years
> 48 years

Let's break it down step by step:

1. The sum of money triples itself in 12 years, so the interest earned is 2 times the principal amount (since it becomes 3 times itself).
2. Since it's simple interest, the interest rate is constant. Let's call the principal amount P and the interest rate R.
3. We know that Interest = Principal x Rate x Time. Since the interest earned is 2P, we can set up the equation:

2P = P x R x 12

4. Simplifying the equation, we get:

2 = 12R

R = 1/6 or 16.67% per annum

5. Now, we want to find out how many years it will take for the sum to become 6 times itself. This means the interest earned will be 5 times the principal amount (since it becomes 6 times itself).
6. Using the same interest rate R, we can set up the equation:

5P = P x R x Time

7. Substituting R = 1/6, we get:
5 = (1/6) x Time

Time = 30 years

So, the correct answer is:
30 years

Which of phrases given below each sentence should replace the phrase printed in bold type to make the grammatically
correct? You need not come unless you want to.
Options :
You don't need to come unless you want to
You come unless you don't want to
You come only when you want to
You needn't come until you don't want to

The correct sentence should be:
You don't need to come unless you want to

The original sentence is a bit awkward and implies that not wanting to come is a condition for coming, which is the opposite of what's intended. The corrected sentence clearly conveys that coming is optional and only necessary if you want to.

The other options don't work as well:

- "You come unless you don't want to" is a bit confusing and implies that coming is the default action, which isn't the intended meaning.
- "You come only when you want to" is close, but it implies that coming is only possible when you want to, rather than it being optional.
- "You needn't come until you don't want to" is incorrect because "needn't" implies that coming is not necessary, but the phrase "until you don't want to" implies that not wanting to come is a condition for coming, which is the opposite of what's intended.

So, the correct answer is:
You don't need to come unless you want to

In a certain code language, "
Options :
ROAD" is written as "URDG".

How is "SAND" written in that code?
VDRG
TDRG
VDQG
UDRG

Let's analyze the given code:

"ROAD" is written as "URDG"

We can see that each letter is replaced by a letter a fixed number of positions down the alphabet.

R -> U (move 2 positions forward)
O -> R (move 2 positions forward)
A -> D (move 2 positions forward)
D -> G (move 2 positions forward)

Using this pattern, let's encode "SAND":

S -> U (move 2 positions forward)
A -> C (move 2 positions forward)
N -> P (move 2 positions forward)
D -> F (move 2 positions forward)

But wait, the options don't have "UCPF". Let's try moving 1 position forward instead:

S -> T (move 1 position forward)
A -> B (move 1 position forward)
N -> O (move 1 position forward)
D -> E (move 1 position forward)

Still, no match. Let's try moving 3 positions forward:

S -> V (move 3 positions forward)
A -> D (move 3 positions forward)
N -> Q (move 3 positions forward)
D -> G (move 3 positions forward)

Ah! We have a match!

So, the correct answer is:
VDQG

> A and B can complete a piece of work in 12 days and 15 days respectively. They started working together but A left after
> 4 days. How long will B take to finish the remaining work?
> Options :
> 6 days
> 8 days
> 7 days
> 9 days

Let's break it down step by step:

1. A and B can complete the work in 12 days and 15 days respectively, so their combined rate of work is:

1/12 + 1/15 = 9/60 = 3/20 of the work per day

2. They worked together for 4 days, so they completed:

(3/20) x 4 = 3/5 of the work

3. This means 2/5 of the work is remaining.
4. B can complete the work in 15 days, so B's rate of work is:

1/15 of the work per day

5. To find out how long B will take to finish the remaining work, we can divide the remaining work by B's rate of work:

(2/5) / (1/15) = (2/5) x (15/1) = 6 days

So, the correct answer is:
6 days

Complete the series 5690, 5121 , 4552, 3983, 3414, 2845, ?
Options :
2276
2356
2516
2456

Let's analyze the series:

5690, 5121, 4552, 3983, 3414, 2845, ?

The pattern appears to be a decrease of 569, 429, 369, 329, 291, ... in each term.

To find the next difference, let's look at the differences between consecutive terms:

5690 - 5121 = 569
5121 - 4552 = 569
4552 - 3983 = 569
3983 - 3414 = 569
3414 - 2845 = 569

The differences are consistent, but they don't quite fit the pattern. Let's try to find a different pattern:

5690 - 569 = 5121
5121 - 568 = 4553 (not 4552, close but not exact)
4552 - 569 = 3983
3983 - 569 = 3414
3414 - 569 = 2845

Wait, what if the pattern is a decrease of 569, but with a slight modification? Let's try subtracting 569 from the last term and see what happens:

2845 - 569 = 2276

Ah! We have a match!

So, the correct answer is:
2276

The day after the day after tomorrow is four days before Monday. What day is it today?
Options :
Monday
Wednesday
Tuesday
Thursday

I'll break it down step by step:

1. "The day after the day after tomorrow" means two days from tomorrow.
2. This day is "four days before Monday", so if we count back four days from Monday, we get:

Monday - 4 days = Thursday

3. But wait, this is two days from tomorrow, so we need to count back two more days:

Thursday - 2 days = Tuesday

4. And today is the day before that:

Tuesday - 1 day = Monday

So, the correct answer is:
Monday

Today is Monday!

A person bought a watch at 20% discount on the labeled price. If he sold the watch for 1600 with a profit of 25%, what
was the labeled price of the watch?
Options :
I ,920
2,100
2000
2240

Let's break it down step by step:

1. The person sold the watch for ₹1600 with a 25% profit, so the cost price (CP) can be found by:

CP = Selling Price / (1 + Profit Percentage)
= 1600 / (1 + 0.25)
= 1600 / 1.25
= ₹1280

2. Since the person bought the watch at a 20% discount on the labeled price, the labeled price (LP) can be found by:

LP = CP / (1 - Discount Percentage)
= 1280 / (1 - 0.20)
= 1280 / 0.80
= ₹1600

3. But wait, this is the price at which the person sold the watch, not the labeled price! Since the person got a 20% discount, the labeled price is:

LP = 1600 / (1 - 0.20)
= 1600 / 0.80
= ₹2000

So, the correct answer is:
2000

Complete the series 3, 7, 23, 95, ?
Options :
62
575
128
479

Let's analyze the series:

3, 7, 23, 95, ?

The pattern appears to be a multiplication of a increasing sequence:

3 × 2 + 1 = 7
7 × 3 + 2 = 23
23 × 4 + 3 = 95

If this pattern continues, the next multiplication factor would be 5, and the next addition would be 4, so:

95 × 5 + 4 = 479

So, the correct answer is:
479

His speech went down well with the majority of the audience.
Options :
found acceptance with
was appreciated by
was attentively listened to by
was applauded by

The correct answer is:
was appreciated by

The phrase "went down well" is an idiomatic expression that means "to be well-received" or "to be appreciated". So, the sentence can be rephrased as:

His speech was appreciated by the majority of the audience.

The other options don't quite fit the context:

- "Found acceptance with" is a bit formal and doesn't convey the same level of enthusiasm as "went down well".
- "Was attentively listened to by" implies that the audience was focused, but doesn't necessarily mean they enjoyed or appreciated the speech.
- "Was applauded by" implies a more physical reaction, whereas "went down well" can also encompass a more subtle, positive response.

> If A + B means A is the mother of B, A- B means A is the brother of B, A % B means A is the father of B, and A * B means
> A is the sister of B, which of the following means M is the maternal uncle of P?
> Options :
> M+N-P
> M-N+P
> M*N%P
> M%N+P

Let's break down the relationships:

- A + B: A is the mother of B
- A - B: A is the brother of B
- A % B: A is the father of B
- A * B: A is the sister of B

We want to find the expression that means M is the maternal uncle of P.

A maternal uncle is the brother of one's mother. So, we need to find an expression that shows M as the brother of P's mother.

Let's analyze the options:

- M+N-P: This means M is the brother of N, and N is the mother of P (since + denotes mother). So, M is the maternal uncle of P.
- M-N+P: This means M is the brother of N, but N is not necessarily P's mother.
- M*N%P: This means M is the sister of N, and N is the father of P (not relevant to maternal uncle).
- M%N+P: This means M is the father of N, and N is the mother of P (not relevant to maternal uncle).

So, the correct answer is:
M+N-P

The ratio of ages of two persons is 4:3. Six years hence, their ages will be in the ratio 5:4. Find their present ages.
Options :
16 and 12
24 and 18
20 and 15
28 and 21

Let's break it down step by step:

1. The ratio of ages of two persons is 4:3, so let their present ages be 4x and 3x.
2. Six years hence, their ages will be 4x + 6 and 3x + 6.
3. The ratio of their ages six years hence is 5:4, so we can set up the equation:

(4x + 6) / (3x + 6) = 5/4

4. Cross-multiplying, we get:

4(4x + 6) = 5(3x + 6)

5. Expanding and simplifying, we get:

16x + 24 = 15x + 30

6. Solving for x, we get:

x = 6

7. So, their present ages are 4x = 24 and 3x = 18.

Therefore, the correct answer is:
24 and 18

She said to her friend, " i know Where is everyone"
She told that she knew where was everyone_
She told her friend that she knew where is everyone-
She told her friend that she knew where was everyone.
She told her friend that she knows where was everyone-

The correct answer is:
She told her friend that she knew where everyone was.

The original sentence is a direct quote, which is a literal representation of what she said. When we report what someone said, we typically change the sentence structure to make it more grammatically correct and clear. In this case, the correct reported speech would be:

"She told her friend that she knew where everyone was."

The other options have errors in verb tense, subject-verb agreement, or word order.

You should open the wine about three hours before you use it.
Options :
Wine should be opened about three hours before use-
Wine should be opened about three hours before you use it
Wine should be opened by you three hours before use.
Wine should be opened about three hours before it is used-

The correct answer is:
Wine should be opened about three hours before use.

or
Wine should be opened about three hours before it is used.

Both of these options are grammatically correct and convey the same meaning as the original sentence.

The other options have slight changes in wording that affect the clarity or tone of the sentence:

- "Wine should be opened about three hours before you use it" is a bit more informal and addresses the reader directly.
- "Wine should be opened by you three hours before use" changes the emphasis to who is opening the wine, rather than when it should be opened.

But overall, the first two options are the most concise and clear ways to express the idea.

If a boat takes 6 hours to travel 60 km downstream and 10 hours to travel the same distance upstream, what is the
speed of the boat in still water?
Options :
5 krn/h
7 km/h
6 km/h
8 krn/h

Let's break it down step by step:

1. Let the speed of the boat in still water be x km/h.
2. Let the speed of the stream be y km/h.
3. When traveling downstream, the boat's effective speed is x + y km/h.
4. When traveling upstream, the boat's effective speed is x - y km/h.
5. We know that the boat takes 6 hours to travel 60 km downstream, so its downstream speed is:

x + y = 60 km / 6 h = 10 km/h

6. We also know that the boat takes 10 hours to travel the same distance upstream, so its upstream speed is:

x - y = 60 km / 10 h = 6 km/h

7. Now we have two equations and two variables. Adding the two equations, we get:

2x = 16 km/h

x = 8 km/h

So, the speed of the boat in still water is 8 km/h.

Therefore, the correct answer is:
8 km/h

> There are eight members in the family. Bravo and Priya are siblings. Angel is Kajal's granddaughter, Kajal who is Priya's
> mother-in-law. Ziva is a married woman and is older than Tim. Tim is the son of Sam who is the brother-in-law of Bravo.
> Smith is the eldest male in the family. Angel is not Ziva's daughter. So how is Bravo related to Ziva?
> Options :
> Son in law
> Husband
> Son
> Brother-in-law

Let's break down the relationships:

- Bravo and Priya are siblings.
- Priya is married to Kajal's son (since Kajal is Priya's mother-in-law).
- Sam is Bravo's brother-in-law, so Sam is married to Bravo's sister (who is Priya).
- Tim is Sam's son, making Tim Bravo's nephew.
- Ziva is a married woman, older than Tim, and not Angel's mother.
- Angel is Kajal's granddaughter, making Kajal Angel's grandmother.

Now, let's find Bravo's relationship with Ziva:

- Since Ziva is not Angel's mother, and Angel is Kajal's granddaughter, Ziva must be Kajal's daughter (Priya).
- But wait, Priya is Bravo's sister!
- So, Ziva (Priya) is Bravo's sister.

But the options don't include "sister". Let's re-examine the relationships:

- Since Ziva is married, and Bravo is Priya's brother, Ziva (as Priya) is married to Bravo's brother-in-law (Kajal's son).
- This makes Bravo the brother-in-law of Ziva's husband, but not directly related to Ziva as a brother-in-law.

The only remaining option that makes sense is:
Husband

Bravo is Ziva's (Priya's) husband.

Pankaj is the son of Rajesh and Sapna, while Deepa is the only granddaughter of Sheela who is the mother of Prakash and Sapna. If Prakash is unmarried and is the brother of the wife of Rajesh, then how is Pankaj related to Deepa?
Options :
Husband
Son-in-law
Uncle
None of the above

Let's break down the relationships:

- Pankaj is the son of Rajesh and Sapna.
- Sapna is the sister of Prakash (since Prakash is the brother of Sapna's husband, Rajesh).
- Deepa is the granddaughter of Sheela, who is the mother of Prakash and Sapna.
- This makes Deepa the daughter of either Prakash or Sapna. But since Prakash is unmarried, Deepa must be the daughter of Sapna.

Now, let's find Pankaj's relationship with Deepa:

- Pankaj is the son of Sapna, and Deepa is the daughter of Sapna.
- This makes Pankaj the brother of Deepa.

So, the correct answer is:
None of the above (since "brother" is not among the options).

However, if I had to choose from the given options, I would say:
Uncle (but this is incorrect, as Pankaj is Deepa's brother, not uncle).

If the ratio of the ages of two persons is 4:5 and the sum of their ages is 45 years, what is the age of the younger person?
Options :
18 years
20 years
21 years
22 years

Let's break it down step by step:

1. The ratio of the ages of two persons is 4:5, so let their ages be 4x and 5x.
2. The sum of their ages is 45 years, so we can set up the equation:

4x + 5x = 45

3. Combine like terms:

9x = 45

4. Divide by 9:

x = 5

5. Now that we know x, we can find the ages:

Younger person: 4x = 4(5) = 20 years
Older person: 5x = 5(5) = 25 years

So, the correct answer is:
20 years

The average of three numbers is 20. If the sum of the first two numbers is 30, what is the third number?
Options :
10
20
30
35

Let's break it down step by step:

1. The average of three numbers is 20, so their sum is:

20 x 3 = 60

2. The sum of the first two numbers is 30, so let's call the third number x.

3. We can set up the equation:

30 + x = 60

4. Subtract 30 from both sides:

x = 30

So, the correct answer is:
30

The three numbers are 15, 15, and 30, or any other combination that adds up to 60.

The new CEO pledged to deal with the company's environmental issues.
Options :
Implicated
Affirmed
Negated
Engrossed

The correct answer is:
Affirmed

The sentence means that the new CEO promised to address and resolve the company's environmental issues. "Affirmed" is a synonym for "pledged" or "promised", indicating a commitment to take action.

The other options don't fit the context:

- "Implicated" means involved or connected, often in a negative way.
- "Negated" means denied or contradicted, which is the opposite of what the CEO did.
- "Engrossed" means fully absorbed or occupied, which doesn't fit the meaning of the sentence.

So, "affirmed" is the best choice!

> A man bought an article for æl ,500 and sold it at a gain of 20%. What is the selling price of the article?
> Options :
> 1700
> 1900
> 1800
> 2000

The correct answer is:
1800

Let's calculate the selling price:

1. The man bought the article for ₹1500.
2. He sold it at a gain of 20%, which means the selling price is 120% of the cost price (100% + 20% gain).
3. To find 120% of ₹1500, multiply by 1.20 (which is the same as 120/100):

₹1500 x 1.20 = ₹1800

So, the selling price of the article is ₹1800.

> A man bought an article for 1500 and sold it at a gain of 20%. What is the selling price of the article?
> Options :
> 1700
> 1900
> 1800
> 2000

To find the selling price, calculate 20% of the cost price and add it to the cost price:

1. Cost price = ₹1500
2. Gain = 20% of ₹1500 = (20/100) x ₹1500 = ₹300
3. Selling price = Cost price + Gain = ₹1500 + ₹300 = ₹1800

So, the correct answer is:
1800

If the ratio of two numbers is 7:5 and their difference is 12, find the numbers.
Options :
42 and 30
35 and 25
28 and 20
35 and 25

Let's break it down step by step:

1. The ratio of the two numbers is 7:5, so let's assume the numbers are 7x and 5x.
2. Their difference is 12, so we can set up the equation:

7x - 5x = 12

3. Simplify the equation:

2x = 12

4. Divide by 2:

x = 6

5. Now that we know x, we can find the numbers:

Number 1: 7x = 7(6) = 42
Number 2: 5x = 5(6) = 30

So, the correct answer is:
42 and 30

A sum of 8000 amounts to 9680 in 2 years at simple interest. What is the rate of interest per annum?
Options :
0.08
0.12
0.1
0.09

Let's break it down step by step:

1. Principal amount (P) = ₹8000
2. Amount after 2 years (A) = ₹9680
3. Interest (I) = A - P = ₹9680 - ₹8000 = ₹1680
4. Time (T) = 2 years
5. Rate of interest (R) = (I / (P x T)) x 100

Plug in the values:

R = (₹1680 / (₹8000 x 2)) x 100
R = (₹1680 / ₹16000) x 100
R = 0.105 x 100
R = 10.5%

So, the correct answer is:
0.1 (approximately, since 0.105 is close to 0.1)

If SUMMER is coded RUNNER, the code for WINTER is
Options :
SUITER
WALKER
VIOUER
SUFFER

The coding pattern appears to be a simple letter substitution, where each letter is replaced by a letter a fixed number of positions down the alphabet.

In the given example, SUMMER is coded as RUNNER, which suggests a shift of 2 positions backward in the alphabet (S becomes R, U becomes N, etc.).

Applying the same pattern to WINTER:

W -> V (shift 2 positions backward)
I -> O
N -> L
T -> R
E -> U
R -> P

So, the coded word for WINTER is VOLURP, but this is not among the options. However, if we consider a shift of 3 positions backward, we get:

W -> U
I -> H (not among the options, but let's continue)
N -> K (not among the options, but let's continue)
T -> R
E -> U
R -> P

Wait, this doesn't match any option either. Let's try a shift of 1 position backward:

W -> V
I -> H (not among the options, but let's continue)
N -> M (not among the options, but let's continue)
T -> S
E -> D (not among the options, but let's continue)
R -> Q (not among the options, but let's continue)

Still, no match. Let's try a shift of 1 position forward:

W -> X (not among the options, but let's continue)
I -> J (not among the options, but let's continue)
N -> O
T -> U
E -> F
R -> S

Still, no match. Let's re-examine the options:

- SUITER: This looks promising, as it's similar to the original word WINTER.
- WALKER: This doesn't match the pattern.
- VIOUER: This doesn't match the pattern.
- SUFFER: This doesn't match the pattern.

Considering the options, SUITER seems to be the closest match, possibly with a combination of letter substitutions and rearrangements.

So, the correct answer is:
SUITER

Cost price of 20 articles is equal to selling price of x articles. If the profit is 25%, then the value of x is
Options :
15
18
16
None of the above

Let's break it down step by step:

1. Let the cost price of 1 article be ₹1.
2. Cost price of 20 articles = ₹20.
3. Since the profit is 25%, the selling price of 20 articles = ₹20 + (25% of ₹20) = ₹20 + ₹5 = ₹25.
4. The selling price of x articles is equal to the cost price of 20 articles, which is ₹25.
5. Since the cost price of 1 article is ₹1, the cost price of x articles = ₹x.
6. The selling price of x articles is 25% more than the cost price, so we can set up the equation:

₹x + (25% of ₹x) = ₹25

7. Simplify the equation:

₹x + ₹0.25x = ₹25
₹1.25x = ₹25

8. Divide by 1.25:

₹x = ₹20

9. So, the value of x is:
x = 20 / 1.25
x = 16

So, the correct answer is:
16

If a train travels 180 km in 3 hours, what is its average speed in km/h?
Options :
60 km/h
70 km/h
50 krn/h
80 krWh

To find the average speed, divide the distance traveled by the time taken:

Average speed = Total distance ÷ Total time
= 180 km ÷ 3 hours
= 60 km/h

So, the correct answer is:
60 km/h

If 6 workers can complete a task in 10 days, how many days will it take for 15 workers to complete the same task?
Options :
2 days
4 days
3 days
5 days

¡Easy one!

If 6 workers can complete the task in 10 days, it means the total work required is 6 workers x 10 days = 60 worker-days.

If we have 15 workers, the total work required remains the same (60 worker-days). To find the number of days, divide the total work by the number of workers:

60 worker-days ÷ 15 workers = 4 days

So, the correct answer is:
4 days

Which number should come next in the series? 3, 9, 27, 81, .
Options :
243
324

162
108

The pattern in the series is obtained by multiplying the previous term by 3:

3 × 3 = 9
9 × 3 = 27
27 × 3 = 81
81 × 3 = 243

So, the correct answer is:
243

What is the least common multiple (LCM) of 12 and 18?
Options :
72
108
36
54

To find the least common multiple (LCM) of 12 and 18, we need to list the multiples of each number:

Multiples of 12: 12, 24, 36, 48, 60, 72, ...
Multiples of 18: 18, 36, 54, 72, ...

The smallest number that appears in both lists is the LCM, which is:
36

However, I notice that 72 is also a common multiple, and it's actually the smallest multiple that is a multiple of both 12 and 18 without leaving a remainder. So, the correct answer is actually:
72

I apologize for the initial mistake!

If the code for CAT is 3120, what is the code for DOG?
Options :
4157
5147
4158
5148

Let's analyze the code for CAT:

C = 3
A = 1
T = 2

The code seems to be based on the alphabetical position of each letter, where A=1, B=2, C=3, and so on.

If we apply this logic to DOG:

D = 4
O = 15
G = 7

So, the code for DOG would be:
4157

The correct answer is:
4157

> A train travels 60% faster than a car. Both start from point A at the same time and reach point B, 120 km away from A at
> the same time. During the journey, the train stops for 15 minutes due to signal delays. What is the speed of the car?
> Options :
> 135
> 180
> 120
> 150

Let's break it down step by step!

1. Let the speed of the car be x km/h.
2. Since the train travels 60% faster, its speed is 1.6x km/h (100% + 60% = 160% = 1.6 times the car's speed).
3. Both the car and the train cover the same distance (120 km) in the same time.
4. However, the train stops for 15 minutes, which means it travels for 15 minutes less than the car.
5. Convert the stoppage time to hours: 15 minutes = 0.25 hours.
6. The time taken by the car to cover 120 km is: t = distance/speed = 120/x hours.
7. The time taken by the train to cover 120 km is: t - 0.25 hours (since it stops for 0.25 hours).
8. Since the train travels at 1.6x km/h, the time taken is: (120 km) / (1.6x km/h) = 120/1.6x hours.
9. Equate the times: 120/x = 120/1.6x - 0.25.
10. Simplify and solve for x:

120/x = 75/x - 0.25
120 = 75 - 0.25x
45 = 0.25x
x = 180 km/h

So, the correct answer is:
180

A boat goes 12 km upstream in 48 minutes. The speed of stream is 2 km/hr. The speed of boat in still water is
Options :
15 km/hr
17 km/hr
16 km/hr
18 krn/hr

Let's break it down step by step!

1. First, convert the time from minutes to hours: 48 minutes = 0.8 hours.
2. The speed of the boat upstream (against the stream) is: Speed = Distance / Time = 12 km / 0.8 hours = 15 km/h.
3. Since the speed of the stream is 2 km/h, the speed of the boat in still water is the sum of its upstream speed and the stream's speed: Speed in still water = Upstream speed + Stream speed = 15 km/h + 2 km/h = 17 km/h.

So, the correct answer is:
17 km/hr

In a certain code FIRE is coded as DGPC. What will be the last letter of the coded word for SHOT.
Options :
Q
R
P
S

Let's analyze the code:

FIRE is coded as DGPC

We can see that each letter is replaced by a letter a fixed number of positions ahead of it in the alphabet. Specifically:

F -> D (shift 2 positions backward)
I -> G (shift 2 positions backward)
R -> P (shift 2 positions backward)
E -> C (shift 2 positions backward)

Applying the same pattern to SHOT:

S -> P (shift 2 positions backward)
H -> F (shift 2 positions backward)
O -> M (shift 2 positions backward)
T -> R (shift 2 positions backward)

So, the coded word for SHOT is PFMQ.

The last letter of the coded word is:
Q

A shopkeeper gives a discount of 10% on the marked price and still makes a profit of 20%. If the marked price is 500,
what is the cost price?
Options :
350
400
450
375

Let's break it down step by step:

1. Marked price = ₹500
2. Discount = 10% of ₹500 = ₹50
3. Selling price = ₹500 - ₹50 = ₹450
4. Profit = 20% of the cost price
5. Let the cost price be x
6. Then, 20% of x = ₹450 - x (since profit is the difference between selling price and cost price)
7. 0.20x = 450 - x
8. 1.20x = 450
9. x = 450 / 1.20
10. x = 375

So, the correct answer is:
375

He exclaimed with joy that India had won the Sahara Cup.
Options :
He said, "India has won the Sahara Cup"
He said, "Howl India will win the Sahara Cup"
He said, "India won the Sahara Cup"
He said, "Hurrah! India has won the Sahara Cup"

The correct answer is:
He said, "Hurrah! India has won the Sahara Cup"

The word "exclaimed" indicates that the person expressed strong emotions, in this case, joy. The interjection "Hurrah!" is a typical expression of excitement, joy, or celebration, which fits the context. The other options do not convey the same level of excitement and joy.

A person of good understanding knowledge and reasoning power
Options :
Expert
Snob
Intellectual
Literate

The correct answer is:
Intellectual

An intellectual person is someone who possesses a high degree of understanding, knowledge, and reasoning power. They are able to think critically, analyze complex information, and make informed decisions.

An expert is someone with specialized knowledge or skills in a particular area, but not necessarily with broad intellectual abilities.

A snob is someone who has a superiority complex and looks down on others, which doesn't necessarily relate to intellectual abilities.

A literate person is someone who can read and write, but this doesn't necessarily imply a high level of understanding, knowledge, or reasoning power.

My cousin said, "My room-mate had snored throughout the night."
Options :
my cousin said that her room-mate snored throughout the night-
my cousin complained to me that her room-mate is snoring throughout the night
my cousin told me that her room-mate snored throughout the night
my cousin felt that her room-mate may be snoring throughout the night.

The correct answer is:
my cousin told me that her room-mate snored throughout the night

The original sentence is in direct speech, and the correct option converts it into indirect speech while maintaining the same meaning.

The other options change the meaning or tone of the original sentence:

- Option 1 changes the pronoun to "her", which may not be the case.
- Option 2 adds a sense of complaint, which is not present in the original sentence.

- Option 4 adds a sense of uncertainty, which is not present in the original sentence.

Option 3 is the most accurate conversion from direct to indirect speech.

Which of phrases given below each sentence should replace the phrase printed in bold type to make the grammatically
correct? Had I realised how close I was to the edge of the valley, I would not have carried the bags there
Options :
Had I been realised
When I realised
If I would have realised
No correction required

Here's the correct answer:

No correction required

The original sentence is already grammatically correct. It's a correct use of the third conditional (past perfect + would have + past participle) to express a hypothetical past situation and its consequences.

The other options are incorrect:

- **Had I been realised** is incorrect because "realised" is not a passive verb, and "had I been" is used for passive constructions.
- **When I realised** changes the meaning to a specific point in time, rather than a hypothetical situation.
- **If I would have realised** is incorrect because it's a mix of the second and third conditionals, and the verb tense is inconsistent.

So, no correction is required!

In alphabet series, some alphabets are missing which are given in that order as one of the alternatives below it. Choose
the correct alternative.
Options :
G4T
M20P
JIOR
p43N

Let's analyze the series:

The pattern appears to be an increment of 3 in the alphabetical order, with some letters missing.

The correct sequence should be:
G, H, I, J, K, L, M, N, O, P

Comparing the options:

- G4T: Incorrect (should be G, H, I, J, K, L, M, N, O, T)
- M20P: Incorrect (should be M, N, O, P)
- JIOR: Correct (matches the sequence: J, K, L, M, N, O, R is missing, but the sequence is correct)
- p43N: Incorrect (should be P, Q, R, S, T, U, V, W, X, Y, Z, and then N)

So, the correct answer is:
JIOR

At a conference, 12 members shook hands with each other before & after the meeting. How many total number of hand
shakes occurred?
Options :
132
122
100
145

Let's calculate the total number of handshakes:

1. Before the meeting, each member shook hands with 11 other members, so there were 12 x 11 = 132 handshakes.
2. However, this counts each handshake twice (once for each person involved), so we divide by 2: 132 / 2 = 66 handshakes before the meeting.
3. The same applies after the meeting, so there were also 66 handshakes after the meeting.
4. In total, there were 66 + 66 = 132 handshakes.

So, the correct answer is:
132

The average of five numbers is 24. If one of the numbers is excluded, the average becomes 20. What is the excluded
number?
Options :
40
35
36
38

Let's solve it step by step:

1. The average of five numbers is 24, so their sum is: 5 x 24 = 120.
2. If one number is excluded, the average becomes 20, and there are four numbers left. Their sum is: 4 x 20 = 80.

3. The excluded number is the difference between the original sum and the new sum: 120 - 80 = 40.

So, the correct answer is:
40

This means the excluded number is 40, which is higher than the original average, causing the new average to be lower (20).

> If in a certain language PROSE is coded as PPOQE, how is LIGHT coded in that code ?
> Options :
> LIGFT
> LGGHT
> LGGFT
> LLGFE

Let's analyze the code:

PROSE is coded as PPOQE

We can see that each letter is replaced by a letter a fixed number of positions ahead of it in the alphabet. Specifically:

P -> P (no change)
R -> P (shift 1 position backward)
O -> O (no change)
S -> Q (shift 1 position backward)
E -> E (no change)

Applying the same pattern to LIGHT:

L -> L (no change)
I -> H (shift 1 position backward)
G -> G (no change)
H -> G (shift 1 position backward)
T -> F (shift 1 position backward)

So, the coded word for LIGHT is:
LGGFT

This matches the pattern of replacing each letter with a letter a fixed number of positions ahead or backward in the alphabet.

> A basket contains 120 apples. If 30% of the apples are spoiled, how many good apples are there?

To find the number of good apples, we need to calculate the number of spoiled apples and subtract them from the total number of apples.

Number of spoiled apples = 30% of 120
= (30/100) × 120
= 36

Number of good apples = Total apples - Spoiled apples
= 120 - 36
= 84

So, there are **84** good apples.

A mixture contains alcohol and water in the ratio 4:3. If 7 liters of water is added to the mixture, the ratio of alcohol to
water becomes 4:5. What is the quantity of alcohol in the original mixture?
Options :
8 liters
12 liters
10 liters
14 liters

Let's break it down step by step:

Initially, the ratio of alcohol to water is 4:3. Let's assume the quantity of alcohol is 4x and water is 3x.

When 7 liters of water is added, the new ratio becomes 4:5. The quantity of alcohol remains the same, but the water increases to 3x + 7.

We can set up an equation based on the new ratio:

4x / (3x + 7) = 4/5

Cross-multiplying:

20x = 4(3x + 7)

Expanding:

20x = 12x + 28

Simplifying:

8x = 28

x = 28/8
x = 3.5

Now, we can find the original quantity of alcohol:

Alcohol = 4x
= 4(3.5)
= **14 liters**

So, the correct answer is:
14 liters

The invigilator was reading out the instructions.
Options :
The instructions were read by the invigilator.
The instructions had been read out by the invigilator-
The instructions were being read out by the invigilator-
The instructions had been read by the invigilator_

The correct answer is:
The instructions were being read out by the invigilator.

The original sentence is in the simple past tense, describing an action that was in progress at a specific point in the past. The correct passive voice equivalent is the past continuous tense, which describes an action that was ongoing at a specific point in the past.

Here's a brief explanation of the other options:

- **The instructions were read by the invigilator**: Simple past tense, implies the action is completed.
- **The instructions had been read out by the invigilator**: Past perfect tense, implies the action was completed before another action in the past.
- **The instructions had been read by the invigilator**: Past perfect tense, implies the action was completed before another action in the past, but doesn't fit the context of reading out instructions.

DEF, DEF2, DE2F2,_____,D2E2F3
Options :
D2E2F3
DEF3
D2E3F
D3EF3
D2E2F2

The pattern appears to be an increment in the powers of the letters:

- DEF (base)
- DEF2 (each letter's power is increased by 1)
- DE2F2 (each letter's power is increased by 1 again)
- D2E2F3 (each letter's power is increased by 1 again)
- D3E3F4 (following the pattern, each letter's power should increase by 1 again)

However, the correct answer is not explicitly listed. The closest match is:
D2E2F3, but it's not the next in the sequence.

If we follow the pattern, the correct answer should be:
D3E3F4, but it's not listed.

Among the options, the one that best fits the sequence is:
D2E2F3, although it's not the next in the sequence. If I had to choose, I'd say:

D2E2F3, but keep in mind it's not the perfect fit.
